**Appendix 7.5 – Representative Viewpoint Sensitivity** and Effects

## **APPENDIX 7.5 – REPRESENTATIVE VIEWPOINT SENSITIVITY AND EFFECTS**

## **Appendix Tables**

Table 1: Viewpoint Effects Assessment: Construction and Operation

## 1. Viewpoint Effects

## 1.1 Introduction

- 1.1.1. This Appendix provides an assessment from the agreed Viewpoints, as requested by THC (see Table 7.1, of Chapter 7: Landscape and Visual). The methodology used for assessment is the same as for the main assessment, as outlined in Appendix 7.1: Landscape and Visual Impact Assessment Methodology, with visualisations produced in accordance with the Methodology outlined in Appendix 7.2: Visualisation Methodology.
- 1.1.2. Where the viewpoint is representative of more than one type of receptor, consideration of the different sensitivity levels of each receptor type is provided, and subsequent assessment carried out accordingly.
- 1.1.3. Table 1.1 should be read in conjunction with Chapter 7: Landscape and Visual.
- 1.1.4. The Zone of Theoretical Visibility are shown in the following figures:
  - Volume 3: Figure 7.1: Zone of Theoretical Visibility 10 km Study Area Bare Earth
  - Volume 3: Figure 7.2: Zone of Theoretical Visibility 10 km Study Area Screening
  - Volume 3: Figure 7.3A: Zone of Theoretical Visibility The Highland Council, Caledonian Canal Crossing -Bare Earth
  - Volume 3: Figure 7.3B: Zone of Theoretical Visibility The Highland Council, The Caledonian Canal -Screening
  - Volume 3: Figure 7.3C: Zone of Theoretical Visibility Kellas Alternative Alignment Bare Earth
- 1.1.5. The viewpoint locations are shown in the following figures:
  - Volume 3: Figure 7.6: Visual Amenity Receptors and Viewpoint Locations
  - Volume 3: Figure 7.7: Visual Context
- 1.1.6. The viewpoint visualisations are shown in the following figures:
  - Volume 4: Visualisation 7.1 Viewpoint 1 to 7.65 Viewpoint 65
  - Volume 4: THC Visualisation THC 1 Viewpoint 1 to THC 22 Viewpoint 58.
- 1.1.7. NOTE: Consideration of Year 15 effects is only given where there is a significant proportion of additional forestry management felling¹ or forest edge fringe planting² in the view. Any felling undertaken out with the Operational Corridor (OC) would be solely under the control of the relevant landowner (and not the Applicant). For the purposes of this assessment, it has been assumed that management felling would take place and that areas of management felling would be replanted back to the edge of the OC following installation of the overhead line (OHL (see Chapter 12: Forestry for further details)) and would therefore, after 15 years, provide additional screening. No other planting mitigation is proposed and therefore the majority of receptors would not have a different visual experience at Year 15. As a result, only a small proportion of receptors below are required to be considered at Year 15. Where they are, assessment at Year 15 is included.
- 1.1.8. Note also that where year 15 assessment is included, an additional visualisation has been included to show both the regrowth of management felling areas back to the edge of the OC and of establishing forest edge fringe planting growth at an interim year of year 7, in addition to year 15. The year 7 visualisations demonstrate the likely growth of forestry within the management felling areas or forest edge fringe planting by this stage, as requested by The Highland Council (THC). However, given the small change in growth between the year of opening and year 7, this additional scenario has not been considered in the assessment of effects as no change to magnitude is anticipated at year 7 due to the limited extent of planting in views. year 7 effects are therefore considered to be the same as year of opening in assessment terms.
- 1.1.9. As stated in **Appendix 7.1**, professional judgement is used to determine whether effects of Moderate Adverse are considered to be significant or non-significant. Where an effect of Moderate Adverse is identified as being non-significant, qualification is provided in each instance as to why it is considered non-significant.

<sup>&</sup>lt;sup>1</sup> Management felling is defined as areas of felling beyond the OC to the nearest 'windfirm' edge (known as the 'green edge'), where the trees have developed next to open ground, in order to reduce the risk of windthrow.

<sup>&</sup>lt;sup>2</sup> Forest edge fringe planting refers to deciduous planting within the OC proposed in order to soften the appearance of the coniferous forest edge.

Table 1.1: Viewpoint Effects Assessment: Construction and Operation

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
(Representative)	View southeast from Black Bridge on C1106 Fanellan Road crossing the River Beauly, Kilmorack (249731, 844091)	Residential - High  Recreational - Medium to High  Transport - Medium	625 m	Existing View  The viewpoint is located on Black Bridge as it crosses the River Beauly, facing south along the river looking towards The Aird. Within the view the landscape is predominantly rural and well wooded in character, resulting in a sense of enclosure. Open views are available over the River Beauly towards a recreational picnic area, fishing point and Old Kilmorack burial ground. Riverside woodland frames the view and limits low-level views beyond the mid-distance. The rising landform of The Aird is visible above intervening woodland in the background of the view. Urban influences are limited to Black Bridge in the foreground and a small, gravelled	N/A	N/A
				Construction Construction Construction activity, principally the use of cranes for tower installation and potential use of helicopters for conductor stringing, would create noticeable movements and elements above the treeline and the River Beauly in the mid-distance. Felling is unlikely to be noticeable.  The magnitude of change is assessed as Low to Medium. The geographical extent is low to	During Construction  Low to Medium	During Construction Residential Receptors: Moderate Adverse (significant Recreational Receptors: Moderate Adverse (significant Transport Receptors: Minor to Moderate Adverse (non-significant)
				medium, and the duration would be short-term.  View During Operational Phase - Year of Opening (Winter)  Whilst most of the Proposed Development to the north and south would be screened from view by the mature vegetation along the banks of the River Beauly (even in winter), the upper portion of one tower, potentially	Operational Phase – Year of Opening (Winter)  Low to Medium	Operational Phase - Year of Opening (Winter) Residential Receptors: Moderate Adverse (significant Recreational Receptors: Moderate Adverse (significant

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				two, as well as conductors would appear above the River Beauly in the mid-distance. The tower would be partially backclothed by The Aird but would appear against the skyline and would introduce new detracting urban elements into the rural view.  The magnitude of change is assessed as <b>Low to Medium</b> . The geographical extent is low to medium, and the duration would be long-term.		Transport Receptors:  Minor to Moderate Adverse (non-significant)
				View During Operational Phase - Year of Opening (Summer)  Views from Black Bridge would not substantially change in summer in terms of the extent of visibility of the Proposed Development. Whilst deciduous vegetation on the banks of the River Beauly would offer a small degree of additional screening for more distant towers, the openness of the River Beauly remains unchanged, resulting in the Proposed Development remaining visible on the skyline. The magnitude of change is assessed as remaining Low to Medium. The geographical extent is low to medium, and the duration would be long-term.	Operational Phase - Year of Opening (Summer)  Low to Medium	Operational Phase - Year of Opening (Summer) Residential Receptors: Moderate Adverse (significant) Recreational Receptors: Moderate Adverse (significant) Transport Receptors: Minor to Moderate Adverse (non-significant)
Viewpoint 2: Creraig (Crerag)  (Representative)  Viewpoint location can be found on page 2 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.2: Viewpoint 2: Creraig (Crerag)	View northeast from unnamed road, Creraig (Crerag) (247871, 840927)	Residential - High  Transport - Medium	1666 m	Existing View The elevated viewpoint is located off a local road between Creraig (Crerag) and Culburnie, facing north-east towards the River Beauly valley. Within the view, the landscape is predominantly rural in character. Rough grassland / pastoral land in the foreground slopes down to the mature broadleaved woodland in the mid-distance. Urbanising influences are present in the form of a mobile home and a line of telegraph poles which runs parallel to the woodland. Beyond	N/A	N/A

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				the woodland, individual scattered properties along Fanellan Road (including Sunnybrae, Bredaig and at Fanellan) and beyond, as well as Ruttle Wood and Tòrr Mòr can be seen. The background of the view is comprised of forested, but settled, distant hills, both to the north and west of the River Beauly and A831. The existing 275 kV OHL within the middistance is a noticeable detracting feature although mostly backclothed by landform and forestry.		
				View During Construction  Small areas of felling of forestry and native broadleaf woodland within and beyond the OC and for access tracks would be perceptible in the mid-distance on the opposite valley side in proximity to Fanellan. The use of cranes for tower installation and potential use of helicopters for conductor stringing would also be noticeable movements and elements in the landscape, albeit at distance and covering a small portion of the view. The magnitude of change is assessed as Low. The geographical extent is low, and the duration would be short-term.	During Construction Low	During Construction Residential Receptors: Minor to Moderate Adverse (non-significant) Transport Receptors: Minor Adverse (non-significant)
				View During Operational Phase - Year of Opening (Winter)  The Proposed Development would be a perceptible feature in the mid-distance from this elevated view, although it would be mostly filtered or interrupted by intervening large areas of mixed woodland and coniferous forestry alongside the foreground road to the north. The Proposed Development would be seen in the context of the existing 275 kV OHL across the slopes of Torr Mòr in the mid-distance, slightly	Operational Phase - Year of Opening (Winter)  Low	Operational Phase - Year of Opening (Winter) Residential Receptors: Minor to Moderate Adverse (non-significant) Transport Receptors: Minor Adverse (non-significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				intensifying the amount of infrastructure in the view, although most of it would be screened by the well wooded farmland. The Proposed Development would also mostly be backclothed by landform and forestry, with only the tops of two towers leading up to Torr Mor likely to impinge into the skyline. Whilst the Proposed Development in proximity to Fanellan would be visible in the mid-distance, the majority of it would be screened from all views to the east due to intervening vegetation. The magnitude of change is assessed as Low. The geographical extent would be low, and the duration would be long-term.		
				View During Operational Phase - Year of Opening (Summer)  In summer months, intervening mixed deciduous woodland in the foreground of views from the road would provide a small degree of additional screening, but the Proposed Development would remain visible on the more open slopes of Torr Mor in the middistance. The magnitude of change is therefore assessed as remaining Low. The geographical extent is low, and the duration would be long-term.	Operational Phase - Year of Opening (Summer)  Low	Operational Phase - Year of Opening (Summer) Residential Receptors: Minor to Moderate Adverse (non-significant) Transport Receptors: Minor Adverse (non-significant)
Viewpoint 3: Ruisaurie  (Representative)  Viewpoint location can be found on page 1 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations	View east and south from unnamed road, Ruisaurie (250248, 846239)	Residential - Medium to High	2091 m	Existing View The viewpoint is located off a local road near Ruisaurie. Within the elevated view the landscape is predominantly rural in character although with some noticeable urban detractors present such as large-scale warehouses, Balblair quarry, and OHLs. Rolling pastoral farmland bound by hedgerows and some stock fencing is visible within the fore and mid-distance of the view, along with individual scattered	N/A	N/A

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
Viewpoint visualisation found on: Visualisation 7.3: Viewpoint 3: Ruisaurie				residential properties and agricultural sheds and farm buildings. Beauly Substation is visible in the mid-distance adjacent to Wester Balblair within a localised depression, whilst existing OHLs are present across the mid-distance converging at Beauly Substation. The well wooded undulating landscape continues within the background of views, preventing the existing OHLs breaking into the skyline. The elevated location of the viewpoint allows for panoramic views across the landscape towards distant hills and mountains.		
				View During Construction  Movement associated with construction activity would be perceptible across the view, especially the use of cranes for tower installation and potential use of helicopters for conductor stringing, as well as felling of some tree blocks, particularly over The Aird on the opposite side of the valley. This would only occupy a small portion of panoramic views but would be somewhat out of character with the surrounding landscape. The magnitude of change is assessed as Low. The geographical extent would be low, and the duration would be short-term.	During Construction Low	During Construction Minor to Moderate Adverse (non-significant)
				View During Operational Phase - Year of Opening (Winter)  The Proposed Development would be a perceptible feature in the mid to far distance within the panoramic view of the attractive rural landscape. It would be seen beyond the existing OHLs, although it would be largely backclothed by the surrounding wooded landscape. Tree removal and crossing the Aird may result in part of the Proposed	Operational Phase - Year of Opening (Winter)  Low	Operational Phase - Year of Opening (Winter)  Minor to Moderate Adverse (non-significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				Development becoming skylined in distant views, slightly adding to the presence of urban influences at this location. Even so, the Proposed Development would not substantially detract from far distant attractive views despite adding a further piece of OHL infrastructure into the landscape in the mid to far-distance. The magnitude of change is assessed as Low. The geographical extent is low, and the duration would be long-term.  View During Operational Phase - Year of Opening (Summer)  In summer months, intervening trees would provide a small degree of additional screening, but the Proposed Development would remain visible above intervening treelines in the mid to far-distance, particularly where the Proposed Development crosses The Aird. The magnitude of change is therefore assessed as remaining Low. The geographical extent is low, and the duration would be long-term.	Operational Phase - Year of Opening (Summer) Low	Operational Phase - Year of Opening (Summer)  Minor to Moderate Adverse (non-significant)
				View During Operational Phase - Year 15 (Summer)  Management felling planting of commercial forestry over The Aird back to the edge of the OC is likely to have reestablished in this time and the area of felling would be less noticeable in the distance. However, the Proposed Development would remain visible above intervening treelines in the mid to far-distance. The magnitude of change is anticipated to remain Low. The geographical extent would be low, and the duration would be long-term.	Operational Phase - Year 15 (Summer) Low	Operational Phase - Year 15 (Summer)  Minor to Moderate Adverse (non-significant)
Viewpoint 4: Beauly	View southeast and southwest from car park off the A862, Beauly	Residential - High	1430 m	Existing View  The viewpoint is located at  Beauly train station car park and	N/A	N/A

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
(Representative)  Viewpoint location can be found on page 1 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.4: Viewpoint 4: Beauly	(252008, 845757)	Recreational - Medium to High  Transport - Medium		extends east to west across a predominantly rural landscape. Views are across large fields in the foreground with roadside trees, and across an attractive, well-wooded river valley in the mid-distance with far-distant views of hills including The Aird to the southeast and Tòrr Mòr to the southwest. Existing 132 kV and 275 kV OHLs can be seen largely backclothed by vegetation and distant hills, although occasionally visible above intervening trees, particularly to the southwest when running on higher ground from the north into Beauly Substation, but they are not a dominant feature in the middistance of broad, rural views. Some properties on the edge of Beauly, and some slightly set back with open space to their front (such as Maple Vale) facing south, would have direct but interrupted, views across farmland to the south, particularly from the first floor towards the well-treed River Beauly corridor		
				and hills beyond.  View During Construction Construction activity, and potentially some loss of tree canopies around the River Beauly and over the Aird, would be perceptible above and beyond intervening trees. The use of cranes for tower installation and potential use of helicopters for conductor stringing would introduce uncharacteristic movement into the landscape and skyline in the mid-distance and background of views, although low-level access works and working areas would be largely screened. The magnitude of change is assessed as Low to Medium. The geographical extent would be low to medium,		During Construction Residential Receptors: Moderate Adverse (non-significant) Recreational: Minor to Moderate Adverse (non-significant) Transport Receptors: Minor to Moderate Adverse (non-significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				and the duration would be short-term.  Effects are identified as Moderate Adverse but non-significant for residential receptors as construction activity would either be screened, or visible across a relatively small portion of the view in the mid-distance only.		
				View During Operational Phase - Year of Opening (Winter)  The Proposed Development would be a perceptible feature in the mid-distance above intervening tree lines and beyond the river corridor for those receptors on the edge of Beauly or with some open views towards the south. The Proposed Development would be visible across a wide portion of the view in the mid-distance, and in combination with the adjacent existing OHL, would increase the overall presence of OHL infrastructure into the landscape in the mid-distance. The removal of the existing 132 kV OHL towers immediately to the fore of the Proposed Development in views would slightly offset the impact of the introduction of new taller towers, but a degree of wirescaping may be seen in small portions of some views. However, the focus of broad views into surrounding farmland and the wooded river valley would not substantially change, and the Proposed Development would be largely backclothed by distant forestry and hills within The Aird. Even so, some towers are likely to be skylined due to relative proximity and the presence of flat, open land to the south of Beauly. The magnitude of change is assessed as Low to Medium.		Opening (Winter) Residential Receptors: Moderate Adverse (non-significant) Recreational Receptors: Minor to Moderate Adverse (non-significant) Transport Receptors: Minor to Moderate Adverse (non-significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				low to medium, and the duration would be long-term.  Effects are identified as Moderate Adverse but nonsignificant for residential receptors as much of the lower-level portions of towers would be screened, with middistance views of upper portions largely backclothed by hills and vegetation. It would be seen in conjunction with some existing infrastructure which already characterises the view.		
				View During Operational Phase - Year of Opening (Summer)  The Proposed Development would continue to be visible in the mid-distance, but some additional screening would be afforded from intervening deciduous vegetation. The magnitude of change is assessed as Low. The geographical extent is low to medium, and the duration would be long-term.	Operational Phase – Year of Opening (Summer) Low	Operational Phase – Year of Opening (Summer) Residential Receptors: Minor to Moderate Adverse (non-significant) Recreational Receptors: Minor to Moderate Adverse (non-significant) Transport Receptors: Minor Adverse (non-significant)
Viewpoint 5: Ardnagrask  (Representative)  Viewpoint location can be found on page 1 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.5: Viewpoint 5: Ardnagrask	View south from Teandalloch Road, Ardnagrask (252069, 848659)	Residential - High	4320 m	Existing View The viewpoint is located off Teandalloch Road near Ardnagrask. The slightly elevated location in the foothills of Cnoc Croit na Maoile and Creag na Manachainn affords open, panoramic mid to far-distant views south across gently undulating, low-lying farmland with distant hills associated with The Aird forming the background of views to the southeast. The Beauly Firth to the east is also visible. Detracting features include the existing 132 kV and 275 kV OHLs clearly visible crossing north-south through Ardnagrask and Teandalloch.	N/A	N/A
				View During Construction  Construction activity, particularly felling, would be distantly	During Construction  Low	During Construction  Minor to Moderate Adverse (non-significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				perceived beyond the River Beauly on The Aird and use of cranes for tower construction and potentially helicopters for conductor stringing would be more noticeable, particularly over The Aird where they would be visible objects in the skyline. Ground-level construction works, and lower lying sections of the Proposed Development would not be readily perceptible; any glimpses would be backclothed by vegetation and hills. The magnitude of change is assessed as <b>Low</b> . The geographical extent is low, and the duration would be short-term.  View During Operational Phase - Year of Opening (Winter) The Proposed Development would be a barely perceptible	Operational Phase – Year of Opening (Winter) Low	Operational Phase – Year of Opening (Winter)  Minor to Moderate Adverse (non-significant)
				feature in the far distance to the south and southeast within panoramic views of the attractive rural landscape. The Proposed Development would be backclothed by hills and vegetation to the south, although where it crosses The Aird, some towers are likely to be skylined and a large area of felling would be noticeable. The Proposed Development would not detract from otherwise attractive views. The magnitude of change is assessed as <b>Low</b> . The geographical extent would be low, and the duration would be long-term.		
				View During Operational Phase - Year of Opening (Summer) In summer months, intervening trees would provide a small degree of additional screening, but the Proposed Development would remain distantly perceivable, particularly crossing The Aird. The magnitude of change remains <b>Low</b> . The	Operational Phase – Year of Opening (Summer) Low	Operational Phase – Year of Opening (Summer)  Minor to Moderate Adverse (non-significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				geographical extent would be low, and the duration would be long-term.		
				View During Operational Phase - Year 15 (Summer)  Management felling planting of commercial forestry back to the edge of the OC is likely to have reestablished in this time and the Proposed Development would be less noticeable in the distance on The Aird. The magnitude of change is anticipated to reduce to <b>Negligible</b> . The geographical extent would be low, and the duration would be long-term.	Operational Phase – Year 15 (Summer) Negligible	Operational Phase – Year 15 (Summer)  Minor Adverse (non-significant)
Viewpoint 6: Kiltarlity  (Representative)  Viewpoint location can be found on page 2 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.6: Viewpoint 6: Kiltarlity	View north from unnamed road, Kiltarlity (251012, 840921)	Residential - High	2479 m	Existing View  The viewpoint is located off an unnamed local road between Tomnacross and Camult Muir and the landscape in the view is predominantly rural in character. The slightly elevated position enables wide open views of the landscape beyond Kiltarlity, although interrupted in the middistance by belts of mixed woodland and vegetated field boundaries alongside Bruiach Burn as well as small areas of coniferous forestry. There are limited detracting features apart from an existing 275 kV OHL in the valley, appearing above intervening vegetation but largely backclothed by rising hills beyond.	N/A	N/A
				View During Construction  Construction activity would be perceptible across the River Beauly and floodplain landscape to the north and northwest, in mid to far-distant views. Activity, including the use of cranes for tower installation and potential use of helicopters for conductor stringing, would be noticeable on the skyline of most views, although ground level	During Construction  Negligible to Low	During Construction  Minor to Moderate Adverse (non-significant)

				extent would be low, and the duration would be long-term.		
Viewpoint 7: Balchraggan  (Representative)  Viewpoint location can be found on page 3 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.7: Viewpoint 7: Balchraggan	View northwest and northeast from Cabrich, Balchraggan (253909, 843516)	Residential - High	856 m	Existing View  The viewpoint is located off Cabrich, near Balchraggan and on the mid slopes of Creag na Nighinn. Views are relatively elevated and open and look across rural farmed floodplains towards the River Beauly / Beauly Firth and rising hills beyond. Fields bound by mature trees and blocks of forestry give the feel of a well wooded landscape and this, along with hills, create some sense of enclosure. Forestry beyond the A862 forms the background of the view along with more distant hills, with traffic on the A862 visible in the mid- distance. Existing 132 kV and 275 kV OHLs are apparent	N/A	N/A
				across the landscape, with some towers impinging into the skyline, detracting from the otherwise attractive rural view.  View During Construction  Lower-level construction activity for some towers (such as installation of tower platforms) would be visible, whilst temporary access tracks through fields to the north would also be noticeable. The use of cranes for tower installation and potential use of helicopters for conductor stringing would be particularly distracting, resulting in conspicuous, uncharacteristic movement and activity in the near to mid-distance landscape, and impinging into the skyline. The	During Construction  Medium to High	During Construction  Major Adverse (significant)
				magnitude of change is assessed as <b>Medium to High</b> . The geographical extent would be medium, and the duration would be short-term. <u>View During Operational Phase - Year of Opening (Winter)</u>	Operational Phase – Year of Opening (Winter)	Operational Phase – Year of Opening (Winter)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				The Proposed Development would be openly perceptible and appear in the near to middistance of views. The new OHL would be seen traversing agricultural fields to the north in combination with the existing retained OHL, which would lie 200-300 m beyond. This would create a degree of wirescaping for some receptors. The removal of one line of existing towers to the north of the A862 would slightly offset the impact of the introduction of larger, taller towers, but the new towers would be visible to some in their entirety and appear in the skyline of views above existing retained towers. The lower portions of the Proposed Development would be backclothed by surrounding fields and woodland. While detracting elements of the A862 and the existing 275 kV OHL would remain visible for residents, the introduction of larger, taller towers within an otherwise attractive rural landscape would further deteriorate near to middistant views. The magnitude of change is therefore assessed as Medium to High. The geographical extent would be medium, and the duration would be long-term.	Medium to High	Major Adverse (significant)
				View During Operational Phase - Year of Opening (Summer)  Summer foliage of field boundary would offer a small degree of additional visual screening of the lower portions of towers, but the Proposed Development would remain openly visible in the middistance and skyline. In combination with the existing 275 kV OHL, it would remain a significant detracting feature. The magnitude of change is considered to be <b>Medium</b> . The geographical extent would be	Operational Phase - Year of Opening (Summer)  Medium	Operational Phase - Year of Opening (Summer)  Moderate to Major Adverse (significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				medium, and the duration would be long-term.		
Easter Moniack	View north and east from local road in Easter Moniack (255187, 844126)	Residential - High	252 m	Existing View  The viewpoint is located off a local road at Lower Achnagairn near Wester Moniack and immediately south of the A862, on the southern edge of the broad River Beauly valley within low lying, well wooded farmland. Views north are near to middistant, often framed or filtered by belts of deciduous woodland, distinctive mature field boundary trees and property curtilage vegetation, giving a moderate sense of enclosure within low lying views. Detracting features include filtered views to moving traffic on the A862 and the existing 132 kV and 275 kV OHLs to the north of the A862 with towers appearing in the skyline.	N/A	N/A
				View During Construction Construction activity, felling and temporary access tracks through agricultural fields would be clearly noticeable and in very close proximity. The use of cranes for tower installation and potential use of helicopters for conductor stringing would be particularly distracting and artificial in the local landscape. The magnitude of change is assessed as <b>High</b> . The geographical extent would be high, and the duration would be short-term.	During Construction  High	During Construction  Major Adverse (significant)
				View During Operational Phase - Year of Opening (Winter)  The Proposed Development would be a prominent feature in the foreground of views and would be openly visible in the near distance. New towers would form prominent vertical features in the skyline of relatively enclosed and framed views, with one angle tower adjacent to the A	Operational Phase - Winter Year of Opening  High	Operational Phase - Winter Year of Opening  Major Adverse (significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				road being particularly prominent and openly visible. The Proposed Development would be seen in the foreground of the existing retained OHL, which runs on slightly higher ground to the north beyond the A862, resulting in a wirescaping effect. The removal of one line of existing towers to the north of the A862 would slightly offset the impact of the introduction of new taller towers, but even so, the scale of the Proposed Development and proximity would result in a magnitude of change being assessed as High. The geographical extent would be high, and the duration would be long-term.  View During Operational Phase - Year of Opening (Summer)  Intervening field boundary trees, property curtilage vegetation and surrounding woodland would offer some additional screening of the Proposed Development in summer months but would still be highly perceptible in the low-lying landscape. The magnitude of change is assessed to remain as High. The geographical extent would be Medium to High, and the duration would be long-term.	Operational Phase - Year of Opening (Summer)  Medium to High	Operational Phase - Year of Opening (Summer)  Major Adverse (significant)
Viewpoint 9: Knockbain (Representative)  Viewpoint location can be found on page 3 of Figure 7.6: Visual Amenity Receptors and	View north and east from unnamed road, Knockbain (255250, 843420)	Residential - High	862 m	Existing View The viewpoint is located off a local unnamed road near Knockbain and the view comprises farmed arable plains with well-wooded field boundaries from the lower slopes of Tor Clunes. The mid-distance of the view is well wooded, giving a	N/A	N/A
Viewpoint Locations  Viewpoint visualisation found on:  Visualisation 7.9: Viewpoint 9:  Knockbain				good sense of enclosure, with the A862 not openly evident. Distant hills and woodland within the farmed plains form the background, with the existing 275 kV OHL perceptible in the middistance generally backclothed by		

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	viewpoint from nearest	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
			proposed tower (m)	hills and obscured by vegetation, although some towers are skylined. The view here across The Aird, with wood poles and wires, post and wire fencing, and plantation woodland, is a little more utilitarian in character.		
				View During Construction  Construction activity would be perceptible in the mid-distance, crossing the view. Ground level construction works would be unlikely to be perceptible, being largely screened from view by intervening vegetation, but construction of the towers through use of cranes for tower installation and potential use of helicopters for conductor stringing would be noticeable movements and uncharacteristic features on the skyline of mid-distant views.  Even so, it would occupy a small portion of the view. The magnitude of change is therefore assessed as Low to Medium.  The geographical extent would be low to medium, and the duration would be short-term.  Effects are identified as Moderate Adverse but nonsignificant for residential receptors as construction activity would either be entirely screened by vegetation or topography, or partially backclothed by vegetation and in the mid-distance only.		During Construction Moderate Adverse (non-significant)
				View During Operational Phase - Year of Opening (Winter)  The Proposed Development would be readily perceptible and appear in the mid-distance of views above intervening tree lines. The new OHL would be seen traversing arable fields in combination with the existing 275 kV OHL, which lies 200 m - 300 m beyond, resulting in a degree	Operational Phase - Year of Opening (Winter)  Low to Medium	Operational Phase - Year of Opening (Winter)  Moderate Adverse (nonsignificant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				of wirescaping for receptors. The lower portions of the Proposed Development would not be readily visible, but some of the upper portions would be skylined. The foreground and background of views would remain unchanged while the middistance would have new vertical features perceptible, introducing additional detracting elements within an otherwise rural and attractive outlook. The nature of views would not substantially change due to the existing OHL being perceptible, but the Proposed Development, where visible, would form a noticeable and discordant element in views. The magnitude of change would therefore be assessed as Low to Medium. The geographical extent would be low to medium, and the duration would be long-term.  Effects are identified as Moderate Adverse but nonsignificant for residential receptors as the Proposed Development would either be screened, or partially backdropped by vegetation, in the mid-distance of views		
				View During Operational Phase - Year of Opening (Summer)  Summer foliage of field boundary trees and surrounding woodland vegetation would all offer additional visual screening, although the Proposed Development would remain visible in the skyline for a portion of the view. The magnitude of change would therefore be assessed as remaining Low to Medium. The geographical extent would be low to medium, and the duration would be longterm.	Operational Phase – Year of Opening (Summer)  Low to Medium	Operational Phase – Year of Opening (Summer)  Moderate Adverse (nonsignificant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				Effects are identified as remaining Moderate Adverse and non-significant for residential receptors as views would be further screened in summer months by surrounding deciduous trees and vegetation.		
				View During Operational Phase - Year 15 (Summer)  Management felling planting of commercial forestry back to the edge of the OC, as well as forest edge fringe planting within the OC itself across The Aird is likely to have re-established in this time. The planting would screen the bases of some of the towers further, although the tops of a limited number of towers would remain visible above the treeline. Deciduous mitigation planting within the OC across The Aird would be noticeable, helping to soften the artificially straight tract of felling by creating a more organic and natural edge across the length of visible hillside. However, towers would remain clearly prominent. The magnitude of change is therefore anticipated to reduce to Low. The geographical extent would be low, and the duration would be long-term.	Operational Phase – Year 15 (Summer) Low	Operational Phase – Year 15 (Summer)  Minor to Moderate Adverse (non-significant)
Viewpoint 10: A832, Newton  (Representative)  Viewpoint location can be found on page 3 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.10: Viewpoint 10: A832, Newton	View south from the A832, Newton (258357, 850523)	Residential - High	6817 m	Existing View The viewpoint is located off the A832 near Newton and comprises low-lying arable farmland to the north of the Beauly Firth. Distant views south are relatively open and extensive with occasional intervening boundary vegetation. Rural farmland characterises the foreground of the view with the Beauly Firth to the foot of well wooded hills beyond, along with hills associated with The Aird and Boblainy Forest seen in the	N/A	N/A

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				background. There are few detracting features apart from utilitarian farm buildings and existing 132 kV and 275 kV OHLs perceptible on the mid slopes of hills beyond the Beauly Firth.		
				View During Construction	During Construction	During Construction
				Construction activity would not be readily perceptible in the fardistant view beyond the Beauly Firth, although use of cranes for tower installation and potential use of helicopters for conductor stringing may be perceptible above the hills and crossing The Aird, together with an area of felling. The magnitude of change is assessed as <b>Negligible</b> . The geographical extent would be negligible, and the duration short-term.	Negligible	Minor Adverse (non-significant)
				View During Operational Phase - Year of Opening (Winter)	Operational Phase – Year of Opening (Winter)	Operational Phase – Year of Opening (Winter)
				The Proposed Development would not be readily perceptible in the far-distant view, although it may be discernible traversing the upper slopes of hills associated with The Aird, particularly through an area of felling. This felling through the OC may be visible, appearing as an artificial straight line through large areas of woodland and coniferous forestry. Towers would generally be backclothed by hills and vegetation, but some may be visible in the skyline over the top of Cnoc na Moine and hills associated with The Aird. Due to the distance of view, and small portion of the view changed, the overall magnitude of change would be assessed as <b>Negligible</b> . The geographical extent would be negligible, and	Negligible	Minor Adverse (non-significant)
				the duration long-term.  View During Operational Phase -	Operational Phase – Year of	Operational Phase – Year of
				Year of Opening (Summer)	Opening (Summer)	Opening (Summer)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				In summer months, the Proposed Development would remain distantly perceivable above intervening treelines or as an artificial line through woodland in the far distance. The magnitude of change would remain <b>Negligible</b> . The geographical extent would be negligible, and the duration long-term.	Negligible	Minor Adverse (non-significant)
Drumchardine southeast of Drum	View west from unnamed road to southeast of Drumchardine (257330, 844464)	east of Drumchardine	1277 m	Existing View  The viewpoint is located off a local unnamed road in Easter Craggach, south of Drumchardine on the steeply rising foothills of The Aird. The view looks across agricultural river plains and is framed by landform and forestry. The wide, panoramic view is backclothed by uninterrupted distant hills and mountains, including Torr Mor and Carn Doire Mhurchaidh. Existing 132 kV and 275 kV OHLs are seen in the mid-distance, appearing above intervening vegetation, but below the skyline, adding prominent detracting features into views. An awareness of traffic on the A862 also detracts from otherwise attractive, albeit somewhat utilitarian, near and mid-distant vistas backdropped by scenic mountains.	N/A	N/A
				View During Construction  Construction activity, felling and temporary access tracks through fields would be particularly noticeable. The construction activity, including use of cranes for tower installation and potential use of helicopters for conductor stringing, would add additional detracting elements into the landscape and disrupt views of the scenic mountain ranges beyond. The magnitude of change is assessed as <b>Medium</b> . The geographical extent would be	<u>During Construction</u> Medium	<u>During Construction</u> Moderate to Major Adverse (significant)

(Representative)	(263218, 842360)			and Lochend. Views through the River Ness valley are attractive, with steep valley sides to the		
Viewpoint location can be found on page 3 of Figure 7.6: Visual Amenity Receptors and				south containing views and more open, low-lying floodplains to the north utilised by agricultural		
Viewpoint Locations  Viewpoint visualisation found on:				farmland allowing for broader views from the road. Pockets of woodland through the valley and		
Visualisation 7.13: Viewpoint 13: A82 Inverness				mature roadside vegetation create an intimate, enclosed wooded river valley landscape		
				enclosing the River Ness and Loch Ness itself, with longer- distant views across the river to		
				more distant hills such as Drummossie Muir and The Aird, forming the background of more		
				distant views. Detracting features are limited to the existing 132 kV and 275 kV OHLs crossing the		
				River Ness and Caledonian Canal just north of Dochgarroch, and traffic on the A82 itself.		
				View During Construction  The use of cranes for tower installation and potential use of	During Construction  Medium	<u>During Construction</u> <b>Moderate Adverse</b> (significant)
				helicopters for conductor stringing, would be readily noticeable on the skyline, whilst		
				construction activity, including some areas of felling on Drummossie Muir and The Aird,		
				as well as temporary access tracks, could be noticeable. Whist mature roadside vegetation and		
				existing woodland would provide some screening, far-distant views through roadside vegetation are		
				afforded across more open ground. Works to remove the existing Beauly to Knocknagael		
				132 kV OHL would also be noticeable, albeit at distance. Prior to the removal, there would		
				be a slight wirescaping effect in combination with the two existing		

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				OHLs. Views would be transient and intermittent, with visibility and prominence of construction works increasing sequentially with proximity, and particularly from the north where roadside vegetation provides less screening. The magnitude of change is assessed as <b>Medium</b> . The geographical extent would be low to medium, and the duration would be short-term.		
				View During Operational Phase - Year of Opening (Winter)  Users of the A82 would be aware of the Proposed Development north of Dochgarroch and traversing the lower to mid-slopes of The Aird to the west. There would be a brief, transient appreciation of a felled clear zone within the forestry on The Aird which would potentially create a slight 'notch' in the skyline and appear as an artificially straight tract across the hillside, albeit only briefly within a transient view, and more noticeable when travelling from the north, where more open views are afforded. Towers would mostly be backdropped by forestry, but some would appear in the skyline of views through and above trees. The removal of the existing Beauly to Knocknagael 132 kV OHL towers from within the view would slightly offset the impact of wirescaping and the introduction of new taller towers in the view. Even so, the magnitude of change is assessed as Medium. The geographical extent would be low to medium, and the duration would be long-term.  Effects are identified as Moderate Adverse but nonsignificant as the Proposed Development would be mostly backdropped by landform,	Operational Phase – Year of Opening (Winter)  Medium	Operational Phase – Year of Opening (Winter)  Moderate Adverse (non-significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				conjunction with more prominent existing OHL infrastructure. OHLs are an existing feature of the baseline view, such that the Proposed Development adds only an incremental increase in infrastructure.		
				View During Operational Phase - Year of Opening (Summer) Roadside vegetation would offer a small degree of additional screening in summer months, but the Proposed Development would still be a detracting feature in transient, intermittent views and appear in the skyline for road users, albeit in this viewpoint clearly seen in conjunction with existing OHLs. The magnitude of change is assessed as remaining Medium. The geographical extent would be low to medium, and the duration would be long-term.  Effects are identified as Moderate Adverse but nonsignificant in summer, as views would be further filtered by deciduous vegetation being in leaf and providing some strengthening of visual screening.		Operational Phase – Year of Opening (Summer)  Moderate Adverse (non-significant)
				View During Operational Phase - Year 15 (Summer)  Management felling planting of commercial forestry back to the edge of the OC, as well as forest edge fringe planting within the OC itself, is likely to have reestablished in this time. The replanted forestry on The Aird would partially screen the lower portions of some individual towers, whilst the fringe planting would help to soften the artificially straight edges to make it appear more natural in the landscape. The magnitude of change is anticipated to reduce to Low to	Operational Phase – Year 15 (Summer)  Low to Medium	Operational Phase – Year 15 (Summer)  Minor to Moderate Adverse (non-significant)

				predominantly attractive landscape would further deteriorate views for receptors within a landscape designated for its value, however receptors would largely be screened from the full scale of the Proposed Development by intervening topography and / or woodland. Therefore, the magnitude of change is assessed as Low. The geographical extent would be low, and the duration would be long-term.  View During Operational Phase - Year of Opening (Summer)  In summer months, views towards the Proposed Development would remain similar as winter views as intervening vegetation present is largely coniferous woodland plantations. Therefore, the magnitude of change is assessed as remaining Low. The geographical extent would be low, and the duration would be long-term.	Operational Phase – Year of Opening (Summer) Low	Operational Phase – Year of Opening (Summer) Residential Receptors: Minor to Moderate Adverse (non-significant) Transport Receptors: Minor Adverse (non-significant)
Viewpoint 21: The Dava Way  (Specific)  Viewpoint location can be found on page 11 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.21: Viewpoint 21: The Dava Way	View northwest and northeast from The Dava Way long distance path/ Scottish Great Trail (302530, 844879)	Recreational – Medium to High	603 m	Existing View  The viewpoint is located on The Dava Way long distance path / Scottish Great Trail to the east of Cairn Eney. Wide open views are available across the open moorlands towards the rising slopes in the background. The open rolling upland landscape allows for open views north and west across the landscape towards the Proposed Development when travelling north. Upland moorland and forestry and narrow wooded valleys can be seen in the midground with rolling forested farmland in the background to the north. Clusters of woodland are visible including the Moss of Bednawinny. An existing 275 kV OHL and Logie Wind Farm	N/A	N/A

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				appear on the skyline and detract from the view.		
				View During Construction  Construction activity, including the use of cranes for tower installation, and felling required for the OC and for temporary access tracks, would be noticeable within open views from The Dava Way. Views of construction activity are likely to appear visible in the mid-distance across the landscape within the valley of the River Divie before becoming obscured by intervening landform to the west beyond Cairn Eney, and to the east by the Moss of Bednawinny. Vegetation at Bantrach Wood and associated with the River Divie would provide a backcloth to views, however the open nature of the landscape would be likely to afford noticeable views towards construction activity across the base of the valley, with use of cranes for tower installation and potential use of helicopters for conductor stringing, impinging into the skyline. However, construction works would be temporary and seen against the existing 275 kV OHL. The magnitude of change is therefore assessed as <b>Medium</b> . The geographical extent would be medium, and the duration would be short-term.	During Construction Medium	During Construction  Moderate Adverse (significant)
				View During Operational Phase - Year of Opening (Winter) The Proposed Development would appear visible from The Dava Way across the more open	Operational Phase – Year of Opening (Winter)  Medium	Operational Phase – Year of Opening (Winter)  Moderate Adverse (significant)
				valley landscape and moorland and would be visible within near and mid-distant views across the base of the valley between Cairn Eney and the River Divie, before extending away to the east. The Proposed Development would be		

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				viewed in the context of the existing 275 kV OHL to which it runs parallel, and the windfarms around Hill of Glaschyle and Berry Burn, which are already present within the wider landscape disrupting the scenic quality of the landscape. However, the Proposed Development would further deteriorate views at this location, reducing the sense of remoteness and introducing further detracting features across the view, albeit backdropped to a degree by Bantrach Wood and the rising landform towards the Hill of Glaschyle to the east. The magnitude of change is therefore assessed as Medium. The geographical extent would be medium, and the duration would be long-term.  View During Operational Phase - Year of Opening (Summer)  Summer foliage would further backcloth views and filter views towards the base of the proposed towers, but not to the degree that they would noticeably change the extent of views towards the Proposed Development from this location. The magnitude of change is therefore assessed as remaining Medium. The geographical extent would be medium, and the duration would be long-term.	Operational Phase – Year of Opening (Summer) Medium	Operational Phase – Year of Opening (Summer)  Moderate Adverse (significant)
Viewpoint 22: Carnach  (Representative)  Viewpoint location can be found on page 11 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations	View southeast and southwest from unnamed road, south of Carnach (302849, 846499)	Residential - High  Transport – Medium	797 m	Existing View The viewpoint is located on an unnamed road near Carnach. Wide open views are available of open agricultural land in the foreground, with the undulating, well treed and rural landscape of the River Divie valley in the middistance, and the Knock of Braemorary and slightly more distant hills in the background. Views of an existing 275 kV OHL	N/A	N/A

				screen or soften the appearance of the lower to mid portions of some individual towers, but the Proposed Development would remain noticeable and appear in the skyline across the wider view. The impact from the Proposed Development is likely to lessen slightly after establishment of forestry back to the edge of the OC, although it would remain visible on the skyline across a moderate portion of the view. The magnitude of change is therefore assessed as remaining Low to Medium. The geographical extent would be long-term. Effects are identified as remaining Moderate Adverse and non-significant for residential receptors as additional planting would not readily alter the visibility of the Proposed Development across the wider view.		
Viewpoint 24: B9010, Kellas  (Representative)  Viewpoint location can be found on page 14 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.24: Viewpoint 24: B9010, Kellas	View east and south from the B9010 in Kellas, south of the Pluscarden Valley SLA (317077, 854497)	Residential - High  Transport – Medium	2484 m	Existing View The viewpoint is located on the B9010 near the Mill of Kellas Trout Fishery entrance in a landscape characterised by a steep wooded valley with intermittent views towards more distant hills. Open and far-distant views to the south and southeast across the valley floor towards Mill Buie and Cairn Uish are afforded. The view is characterised by an open, grassed valley floor with rising wooded hills beyond. An existing 275 kV OHL is a prominent feature across the valley and in the skyline. Wind turbines associated with Rothes Farm are visible in mid to far-distant views to the southeast.	N/A	N/A
				View During Construction  Construction effects would be largely limited to the background	During Construction Low	<u>During Construction</u>

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				of the view, with the installation of towers across Cairn Uish via cranes and potential use of helicopters for conductor stringing, would impinge into the skyline but would be of similar character to the moving wind turbines on the skyline. The magnitude of change is assessed as <b>Low</b> . The geographical extent would be low, and the duration would be short-term.		Residential Receptors:  Minor to Moderate Adverse (non-significant)  Transport Receptors:  Minor Adverse (non-significant)
				View During Operational Phase - Year of Opening (Winter)  The visibility of the Proposed Development would be highly limited for much of the view, but perceptible in the background of views around Cairn Uish, appearing above the rising ground to the foreground of Rothes Wind Farm. Some of the towers would be skylined, although would be backdropped by, and seen in the context of, surrounding wind turbines and the existing 275 kV OHL. The magnitude of change is assessed as Negligible to Low. The geographical extent would be negligible to low, and the duration would be long-term.	Operational Phase – Year of Opening (Winter)  Negligible to Low	Operational Phase – Year of Opening (Winter) Residential Receptors: Minor to Moderate Adverse (non-significant) Transport Receptors: Negligible to Minor Adverse (non-significant)
				View During Operational Phase - Year of Opening (Summer)  Deciduous vegetation within the valley would contribute to screening of lower portions of towers in particular. However, visibility of the Proposed Development across Cain Uish would still be likely to remain. The magnitude of change is therefore assessed as remaining  Negligible to Low. The geographical extent would be negligible to low, and the duration would be long-term.		Operational Phase – Year of Opening (Summer) Residential Receptors: Minor to Moderate Adverse (non-significant) Transport Receptors: Negligible to Minor Adverse (non-significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				Kellas Alternative Alignment Would be much more perceptible due to proximity. The Proposed Development would be located parallel to, and just behind, the existing 275 kV OHL, becoming a prominent feature within views. It would also be readily visible in views further west on elevated ground at Hatton. The Proposed Development would introduce additional man-made structures above the valley landscape and create a degree of 'wirescaping' but in a relatively small portion of the view. The magnitude of change from this viewpoint is assessed as Medium at both construction and operation.  Deciduous vegetation would not offer much additional screening in summer.	Kellas Alternative Alignment  During Construction  Medium  Operational Phase – Year of Opening (Winter)  Medium  Operational Phase – Year of Opening (Summer)  Medium	Kellas Alternative Alignment  During Construction  Residential Receptors: Moderate to Major Adverse (significant)  Transport Receptors: Moderate Adverse (significant)  Operational Phase – Year of Opening (Winter)  Residential Receptors: Moderate to Major Adverse (significant)  Transport Receptors: Moderate Adverse (significant)  Operational Phase – Year of Opening (Summer)  Residential Receptors: Moderate to Major Adverse (significant)  Transport Receptors: Moderate to Major Adverse (significant)  Transport Receptors: Moderate Adverse (significant)
Viewpoint 25: Mannoch Road Heritage Path  (Specific)  Viewpoint location can be found on page 14 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.25: Viewpoint 25: Mannoch Road Heritage Path	View west and north from the Mannoch Road heritage path on Pikey Hill (321013, 851591)	Recreational – Medium to High	982 m	Existing View The viewpoint is located on the Mannoch Road Heritage Path on the upper western slopes of Pikey Hill. On the higher slopes of Pikey Hill expansive views are afforded across the upland moorland and forestry in which the peaks of Mill Our, The Drum, Hill of the Wangie, Mill Buie, Cairn Uish, Meikle Hill, Cairn of Ballindean and Hill of Blackroads can be seen from the route, together with the large, prominent Rothes Wind Farm on Cairn Uish on the skyline.  View During Construction	N/A  During Construction	N/A  During Construction
				Construction activity would be clearly visible in near to middistance views, with activity impinging into the skyline as it crosses up Mill Our and Pikey Hill. Construction activity would be clearly noticeable for travellers along this stretch of the route, along with any management of	Medium to High	Moderate to Major Adverse (significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				the path whilst works were being undertaken. Construction activity would result in uncharacteristic movement and activity across a large portion of the view. The cranes would represent the tallest features within views where construction activity is located on Mill Our, although views of construction activity to the west would be backclothed by Cairn Uish. The magnitude of change is therefore assessed as Medium to High. The geographical extent would be medium, and the duration would be short-term.  View During Operational Phase - Year of Opening (Winter)  The Proposed Development would cross large portions of the view over the open moorland, albeit seen in conjunction with the large Rothes Wind Farm on Cairn Uish to the west and partially seen in combination with the existing 275 kV OHL which lies 2 km to the north. The Proposed Development would appear prominently on the skyline to the east and west due to lack of woodland and extent of ground-level moorland vegetation. The magnitude of change is assessed as Medium to High. The geographical extent would be medium, and the duration would	Operational Phase – Year of Opening (Winter)  Medium to High	Operational Phase – Year of Opening (Winter)  Moderate to Major Adverse (significant)
				View During Operational Phase - Year of Opening (Summer)  Due to lack of vegetation over the upland forested moorland with coniferous plantations, the magnitude of change is assessed as remaining Medium to High within open, elevated views. The geographical extent would be medium, and the duration would be long-term.	Operational Phase – Year of Opening (Summer) Medium to High	Operational Phase – Year of Opening (Summer)  Moderate to Major Adverse (significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				Kellas Alternative Alignment Would be located and seen further north, skirting around to the west of the summit of Mill Buie, before crossing down on to lower ground to parallel the existing 275 kV OHL at Bodnastalker to the east of the receptors. It then crosses the lower slopes of Mill Our on the eastern side of Glenlatterach Reservoir and passes through a small area of forestry adjoining the reservoir.  The Kellas alternative alignment crosses slightly lower landform and would not be seen so prominently on the higher ground of Mill Our, Cairn Uish and Mill Buie, with towers seen less in combination with turbines on Cairn Uish to the west. It would result in a slightly lower impact on views for users of the nearby section of trail through the upland moorland, although it would still pass directly beneath the Proposed Development and with a larger angle tower adjacent. However, from this particular viewpoint location, it would be more distant, with fewer towers impinging into the skyline. The magnitude of change is assessed as Low to Medium at all stages.	Kellas Alternative Alignment During Construction Low to Medium Operational Phase – Year of Opening (Winter) Low to Medium Operational Phase – Year of Opening (Summer) Low to Medium	Kellas Alternative Alignment  During Construction  Moderate Adverse (significant)  Operational Phase – Year of Opening (Winter)  Moderate Adverse (significant)  Operational Phase – Year of Opening (Summer)  Moderate Adverse (significant)
Viewpoint 26: Elgin  (Representative)  Viewpoint location can be foun on page 13 of Figure 7.6: Visu Amenity Receptors and Viewpoint Locations		Residential - High  Recreational – Medium	5052 m	Existing View The viewpoint is located on Glenlossie Road, south of Elgin. The view encompasses open fields in the foreground including a mosaic of recreational land (driving range), farmland, scrub, and woodland in the near to mid- distance, backclothed by moorland. The topography rises towards the peak of Brown Muir in the mid-distance. Longer distance views to more distant	N/A	N/A

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
Viewpoint visualisation found on: Visualisation 7.26: Viewpoint 26: Elgin				hills beyond are screened by intervening landform ad vegetation. There are few significant detracting features within the landscape apart from an existing 275 kV OHL present in the background and equipment and advertising boards associated with the driving range.		
				View During Construction  Management felling of commercial forestry and native broadleaf woodland beyond the OC and for temporary access tracks would not be readily noticeable in views, with lower- level activity screened from view by intervening topography, vegetation and built form. Use of cranes for tower installation and potential use of helicopters for conductor stringing would be more noticeable on the skyline due to their height and movement, but even so, they would be noticeable across a small portion of the view only. The magnitude of change is assessed as Low. The geographical extent would be Negligible to Low, and the duration would be short-term.	During Construction Low	During Construction Residential: Minor to Moderate Adverse (non-significant) Recreational: Minor Adverse (non-significant)
				View During Operational Phase - Year of Opening (Winter)  The Proposed Development would be a distantly perceptible feature within views south. The tops of towers would be discernible where they cross higher ground on the slopes of Brown Muir and Hart Hill but would be visible across a small portion of the view, with most towers screened by intervening woodland, vegetation, and localised topography. The magnitude of change is therefore assessed as Negligible to Low. The geographical extent would be	Operational Phase – Year of Opening (Winter)  Negligible to Low	Operational Phase – Year of Opening (Winter) Residential Receptors: Minor to Moderate Adverse (non-significant) Recreational Receptors: Negligible to Minor Adverse (non-significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
			proposed tower (m)	negligible, and the duration would be long-term.		
				View During Operational Phase - Year of Opening (Summer) Views of the Proposed Development during the summer months would be similar to those in winter due to the amount of coniferous forestry in the area, although deciduous vegetation in leaf would provide some additional screening for many receptors. Even so, the tops of towers would remain visible over Brown Muir and Hart Hill from this location. The magnitude of change is assessed as remaining Negligible to Low. The geographical extent would be negligible, and the duration would be long-term.	Operational Phase – Year of Opening (Summer)  Negligible to Low	Operational Phase – Year of Opening (Summer) Residential Receptors: Minor to Moderate Adverse (non-significant) Recreational Receptors: Negligible to Minor Adverse (non-significant)
Viewpoint 27: A941, Coleburn  (Representative)  Viewpoint location can be found on page 14 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.27: Viewpoint 27: A941, Coleburn	View northwest from the A941, to the south of Coleburn distillery (324902, 853883)	Residential - High  Transport – Medium	1036 m	Existing View The viewpoint is located on the A941, south of Coleburn and comprises attractive, intermittent views within a mosaic landscape of farmland, moorland, and woodland. There are varying degrees of enclosure due to the rising topography associated with Brown Muir and Hart Hill, and by the extensive woodland across Hart Hill, and through the Glen of Rothes to the south of Coleburn Distillery. Open fields are seen in the foreground framed by the rising sides of the valley slopes of Hart Hill and Brown Muir and the associated woodland. Detracting features include the telecommunications mast on Brown Muir, an existing 275 kV OHL to the north of Brown Muir, and traffic on the A941.	N/A	N/A
				View During Construction  Construction activity would be visible from the road, including	During Construction  Medium to High	During Construction

				towards the Proposed Development would remain similar to winter views. The magnitude of change is therefore assessed as remaining <b>Medium</b> to <b>High</b> . The geographical extent would be medium, and the duration would be long-term.		
				View During Operational Phase - Year 15 (Summer)  Management felling planting of commercial forestry back to the edge of the OC is likely to have re-established in this time. The replanted forestry up Ordiequish Hill could partially screen some individual towers, but the Proposed Development would remain highly visible within the view. The overall effect is unlikely to change as a result and is anticipated to remain as Medium to High. The geographical extent would be medium, and the duration would be long-term.	Operational Phase – Year 15 (Summer)  Medium to High	Operational Phase – Year 15 (Summer) Residential Receptors: Major Adverse (significant) Recreational Receptors: Major Adverse (significant)
Viewpoint 29: Earth Pillars Viewpoint, Ordiequish  (Specific)  Viewpoint location can be found on page 16 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.29: Viewpoint 29: Earth Pillars Viewpoint, Ordiequish	View northwest from the Ordiequish Earth Pillars viewpoint, within The Spey Valley SLA and adjacent to the Speyside Way  (333537, 856531)	Recreational - High	284 m	Existing View The viewpoint is located at the Ordiequish Earth Pillars Viewpoint on Ordiequish Hill on the edge of the River Spey within an area of commercial managed and mixed forestry. The viewpoint is within a tract of cleared woodland created by an existing 132 kV OHL that ascends Ordiequish Hill, and views extend across low-lying agricultural fields that characterise the landscape to the west of the River Spey. Views are well contained until the edge of the escarpment that overlooks the River Spey valley and are mostly orientated to the southwest, but intermittent and heavily filtered views are afforded towards the Proposed Development to the northwest, in which the existing 132 kV OHL forms a prominent feature crossing the river and passing	N/A	N/A

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				overhead. There is an awareness of the 275 kV OHL from the road and car park and particularly where it oversails part of the trail to the south of the official viewpoint but otherwise views are within a tranquil wooded setting and would be highly valued.		
				View During Construction Construction activity would be perceived within filtered views from the viewpoint and trail on the edge of the river, where the installation of towers would be seen in combination with the existing 132 kV OHL, extending across the River Spey valley and further west as the Proposed Development approaches the hill of Brown Muir in the distance. The magnitude of change is assessed as <b>Medium to High</b> from the viewpoint. The geographical extent would be medium, and the duration would be short-term.	During Construction  Medium to High	During Construction Major Adverse (significant)
				View During Operational Phase - Year of Opening (Winter)  The Proposed Development would be seen within views from the designated viewpoint and trails to the north of it on the edge of the hillside, extending through the River Spey valley and rising onto higher landform further west, as well as crossing to the east through open tracts of woodland, albeit with new, immature planting across Ordiequish Hill. The Proposed Development would be seen in combination with the 132 kV primarily, particularly when looking west across the more open valley. This would create a degree of additional wirescaping within filtered, intermittent views across the valley, resulting in a further deterioration of the scenic quality and remote nature of views	Opening (Winter)  Medium to High	Opening (Winter)  Major Adverse (significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				experienced by users. There would be clear views from the viewpoint and edge sections of the trail that overlook the River Spey valley, with the Proposed Development seen in very close proximity to the viewpoint as it crosses up Ordiequish Hill. From this viewpoint location, the magnitude of change is assessed as Medium to High. The geographical extent would be medium, and the duration would be long-term.  View During Operational Phase - Year of Opening (Summer)  Summer foliage of ground cover plants and herbs such as bracken would further contain views for visitors to the viewpoint and trails on the edge of the river, but the Proposed Development would remain a highly noticeable new feature through the valley and beyond to the west, particularly from the public viewpoint. The magnitude of change is therefore assessed as remaining Medium to High. The geographical extent would be medium, and the duration would be long-term.	Operational Phase – Year of Opening (Summer)  Medium to High	Operational Phase – Year of Opening (Summer)  Major Adverse (significant)
Viewpoint 30: Fochabers  (Representative)  Viewpoint location can be found on page 16 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.30: Viewpoint 30: Fochabers	View southwest from the Gordon Castle estate on Core Path CP-FB14, on the northern edge of Fochabers, within the Gordon Castle (Bog of Gight) Garden and Designated Landscape (GDL) and The Spey Valley SLA (335320, 859197)	Recreational – Medium to High	2470 m	Existing View The viewpoint is located to the south of the Gordon Castle estate on the northern edge of the town of Fochabers. The view is characterised by lowland farmland and areas of woodland associated with the Spey Valley, and two church spires are focal points in the skyline. Views to the north of Fochabers are limited to the mid-distance as a result of the intervening lower slopes of Whiteash Hill to the south, and woodland associated with Gordon Castle, to the northwest. Views towards the Proposed Development are mostly screened by surrounding built	N/A	N/A

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				form and the sharply rising landform to the east. There are few visible detracting features within views to the south due to containment of most views by surrounding landform and woodland and the A98 screened by forestry and A96 by roadside belts of trees and shrubs in the mid-distance.		
				View During Construction  Despite the proximity, views of construction activity would be mostly screened by intervening built form, woodland, and topography. The use of cranes for tower installation and potential use of helicopters for conductor stringing would intrude into the skyline of views to the north and edges of Fochabers, although a portion of the view would be screened by the town of Fochabers. The magnitude of change is assessed as Low. The geographical extent would be low, and the duration would be short-term.	During Construction Low	During Construction Residential Receptors: Minor to Moderate Adverse (non-significant) Recreational Receptors: Minor to Moderate Adverse (non-significant)
				View During Operational Phase - Year of Opening (Winter)  The Proposed Development would largely remain screened in views due to the extent of coniferous vegetation on steep hills to the south and east, and by mixed deciduous vegetation along the River Spey. Views are also screened by surrounding built form. Even so, there would be views of the tops of towers as the Proposed Development crossed Ordiequish Hill and potentially further west as it starts to cross slightly higher ground at Altonside. They would slightly detract from the focal point of the church spires by adding additional vertical elements into the view, but the proposed towers would be spaced some distance		Operational Phase – Year of Opening (Winter) Residential Receptors: Minor to Moderate Adverse (non-significant) Recreational Receptors: Minor to Moderate Adverse (non-significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				apart from the existing features and would be limited in extent across the view. The magnitude of change is assessed as <b>Low</b> . The geographical extent would be low, and the duration would be long-term.		
				View During Operational Phase - Year of Opening (Summer)  In summer months, views towards the Proposed Development would remain similar to winter views due to the extent of intervening coniferous vegetation and open farmland. The magnitude of change is therefore assessed as remaining Low. The geographical extent would be low, and the duration would be long-term.	Operational Phase – Year of Opening (Summer) Low	Operational Phase – Year of Opening (Summer) Residential Receptors: Minor to Moderate Adverse (non-significant) Recreational Receptors: Minor to Moderate Adverse (non-significant)
Viewpoint 31: A96, North Bogbain  (Representative)  Viewpoint location can be found on page 17 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.31: Viewpoint 31: A96, North Bogbain	View east and south, from the A96, North Bogbain (339415, 853373)	Transport - Medium	1336 m	Existing View The viewpoint is located on the A96 near North Bogbain, to the southeast of Fochabers. Views from the A96 are elevated and open up onto rolling, relatively open farmland to the northwest of Keith. Cairds Hill and The Balloch (including Meikle Balloch Hill) are distinctive features to the south, with large blocks of forestry, including those associated with Cairds Wood and Balloch Wood. The town of Keith, together with numerous surrounding existing OHLs, Blackhillock Substation, and numerous wind turbines, are all detracting features in the background of an otherwise attractive landscape.	N/A	N/A
				View During Construction In this viewpoint, construction would be seen clearly and prominently across open farmland, with felling noticeable within a block of woodland to the north of Aultmore. Approaching Keith from the northwest, construction would be seen over	<u>During Construction</u> Medium	<u>During Construction</u> Moderate Adverse (significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
			proposed tower (m)	a wide proportion of views through rolling farmland to the north and east of the road and around the northern extent of Keith and Newmill, within more open views. The installation of angle towers and distant awareness of a diamond crossing (OHL Crossing 4) would all increase the prominence of construction activity within views from the around Keith, although they would be seen in the context of numerous existing OHLs and a distant awareness of the Blackhillock Substation. The magnitude of change is assessed as Medium. The geographical extent would be medium, and the duration would be short-term.  View During Operational Phase - Year of Opening (Winter)  The Proposed Development would be a prominent feature in the mid-distance. The introduction of taller towers around the northern and eastern extents of Keith and on the lower slopes of Meikle Balloch Hill would further deteriorate views into the surrounding landscape. Many towers would be seen within the skyline from the road, contributing to the existing wirescape in the mid to far-distant view. The additional infrastructure through the relatively open landscape would further deteriorate round the views, albeit at a little distance from the viewpoint. The magnitude of change is assessed as Medium. The geographical extent would be medium to high, and the duration		Operational Phase – Year of Opening (Winter)  Moderate Adverse (significant)
				would be long-term.  View During Operational Phase - Year of Opening (Summer)  Deciduous roadside and field boundary vegetation would slightly screen views further in	Operational Phase – Year of Opening (Summer) Medium	Operational Phase – Year of Opening (Summer)  Moderate Adverse (significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				summer months but much of the landscape contains coniferous woodland or open farmland. The Proposed Development would remain highly noticeable between the Wood of Ordiequish and Keith, albeit at a little distance from the viewpoint. The magnitude of change is therefore assessed as remaining <b>Medium</b> . The geographical extent would be medium, and the duration would be long-term.		
				View During Operational Phase - Year 15 (Summer)  Management felling planting of commercial forestry back to the edge of the OC is likely to have re-established in this time. The replanted forestry would provide some additional screening of the lower portions of towers at Aultmore and west of Forgie Hill, but the limited extent of replanting elsewhere, coupled with more open views and presence of the Proposed Development on the skyline, would result in the magnitude of change remaining Medium. The geographical extent would be medium, and the duration would be long-term.	Operational Phase – Year 15 (Summer) Medium	Operational Phase – Year 15 (Summer)  Moderate Adverse (significant)
Viewpoint 32: Buckie Fishwives Heritage Path, Newmill  (Representative)  Viewpoint location can be found on page 20 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.32: Viewpoint 32: Buckie Fishwives Heritage Path, Newmill	View northeast and southeast from Buckie Fishwives heritage path to the east of Newmill (343943, 852674)	Recreational – Medium to High	233 m	Existing View The viewpoint is located on the B9017 to the east of Newmill. Broad, attractive views are afforded but become more intermittent through the undulating farmland due to landform, wooded copses, field boundary vegetation and vegetation alongside the Burn of Aultmore. Knock Hill and Meikle Balloch Hill are key landmark features in the background and in closer proximity to Newmill, the existing 132 kV and 275 kV OHLs become more prominent detracting features, intermittently seen in the skyline or backclothed	N/A	N/A

				<u>View During Operational Phase -</u> <u>Year of Opening (Summer)</u>	Operational Phase – Year of Opening (Summer)	Operational Phase – Year of Opening (Summer)
				In summer months, intervening woodland, deciduous field boundary trees and curtilage vegetation would provide slight additional screening through increased leaf cover, however the Proposed Development would remain visible in the mid to far distance above these features against the skyline. The magnitude of change is assessed as remaining Low to Medium. The geographical extent would be low, and the duration would be long-term.  Effects are identified as remaining Moderate Adverse and non-significant for residential receptors as deciduous vegetation would strengthen screening, but the Proposed Development would remain visible.	Low to Medium	Residential Receptors: Moderate Adverse (non-significant) Recreational Receptors: Minor to Moderate Adverse (non-significant) Transport Receptors: Minor to Moderate Adverse (non-significant)
Viewpoint 39: A96, Huntly  (Representative)  Viewpoint location can be found on page 21 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.39: Viewpoint 39: A96, Huntly	View northeast from the A96, to the east of Huntly (354851, 838694)	Residential - High Transport – Medium	12316 m	Existing View The viewpoint is located on the A96 to the southeast of Huntly. Views from Huntly and along the A920 and A96 corridors are within flatter, lower lying ground to the southeast of the Bin, at the confluence of the River Deveron and River Bogie. Set within undulating farmland, the view is contained to the mid-distance by the surrounding hills and woodland associated with Hill of Brunstane / Hill of Greenfold (Kinnoir Wood), White Hill, and Newtongarry Hill / Ream's Hill. The view contains detracting features associated with the busy A96 (including safety barriers and signage), with a 400 kV OHL visible in the distance on the lower slopes of White Hill.	N/A	N/A

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				View During Construction  Construction activity of the upper portions of towers, including use of cranes for tower installation and potential use of helicopters for conductor stringing, would be perceptible as the Proposed Development crosses out from behind Kinnoir Wood (Hill of Brunstane / Hill of Greenfold) across Cruchie Wood and on towards Bogcoup. Most activity would be screened by intervening topography and vegetation and where perceptible, would only be visible across a very small portion of the view. A small number of towers would become skylined to the east of White Hill but seen beyond the foreground highway. The magnitude of change is assessed as <b>Negligible</b> . The geographical extent would be negligible, and the duration would be short-term.	During Construction Negligible	During Construction Residential Receptors: Minor Adverse (non-significant) Transport Receptors: Negligible Adverse (non-significant)
				View During Operational Phase - Year of Opening (Winter)  The Proposed Development would be largely backclothed by fields, woodland, and hills, although some towers would be skylined to the northeast as it crosses higher ground. Even so, it would only be intermittently visible for recreational receptors due to intervening topography and vegetation, and views would be interrupted by detracting foreground features such as signage and traffic on the A96, such that the baseline characteristics would not be readily altered. The magnitude of change is therefore assessed as Negligible. The geographical extent would be long-term.	Operational Phase – Year of Opening (Winter)  Negligible	Operational Phase – Year of Opening (Winter) Residential Receptors: Minor Adverse (non-significant) Transport Receptors: Negligible Adverse (non-significant)
				View During Operational Phase - Year of Opening (Summer)	Operational Phase – Year of Opening (Summer)	Operational Phase – Year of Opening (Summer)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				In summer months, the Proposed Development would be slightly further screened by intervening woodland, along with intervening street and garden trees, but the potential for distant perception of the Proposed Development would remain, particularly where towers would be skylined. Therefore, the magnitude of change is assessed as remaining <b>Negligible</b> . The geographical extent would be negligible, and the duration would be long-term.	Negligible	Residential Receptors: Minor Adverse (non-significant) Transport Receptors: Negligible Adverse (non-significant)
Viewpoint 40: B9025, Foreglen  (Representative)  Viewpoint location can be found on page 22 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.40: Viewpoint 40: B9025, Foreglen	View south from the B9025, Forglen, within the Forglen GDL and Deveron Valley SLA (368944, 851188)	Recreational – Medium  Transport – Medium	5389 m	Existing View The viewpoint is located on the B9025 to the northwest of Turrif. Views south are often limited by undulating topography and areas of woodland, with users travelling along the B9025 experience intermittent views to the south. From this viewpoint, the view south is across agricultural fields towards the valley of the River Deveron to more distant hills. Deciduous woodland to the north of the river characterises middistance views and backcloth far distance views. Settlement is limited to several individual scattered properties positioned within the mid-distance of views including Meikle Ribrae and Ardmiddle Home Farm. Wind turbines on local hills and scattered across a wide portion of the view (including at Mains of Ardmiddle and across Hill of Carlincraig).	N/A	N/A
				View During Construction  Construction activity, particularly the use of cranes for tower installation and potential use of helicopters for conductor stringing, would be distantly perceptible beyond the River Deveron, adding further height and movement into the skyline.  Views however would be filtered	<u>During Construction</u> Negligible	During Construction Residential Receptors: Minor Adverse (non-significant) Recreational Receptors: Negligible Adverse (non-significant) Transport Receptors: Negligible Adverse (non-significant)

				medium, and the duration would be long-term.		
Balquhindachy ur im Ca	unnamed road, Balquindachy, immediately north of the Hatton Castle GDL  (376640, 847689)  und isual	Residential – High  Transport - Medium	671 m	Existing View  The viewpoint is located on a local unnamed road to the east of the A947, southeast of Turriff.  This slightly elevated viewpoint looks across a wide expanse of gently undulating, rolling farmland, with occasional blocks of woodland. The broad, expansive landscape allows for some longer-distance views to the tops of more distant hills, such as Knock hill, although the horizon line is generally formed by a gentler landform. Low hills clothed in woodland form a backdrop to the west and south within the mid-distance. The settlement of Turriff is visible in the far distance on the opposite hillside to the northwest and whilst the landscape is not particularly distinctive, there are few detracting features apart from occasional wind turbines, and telephone poles / wires.		N/A
				View During Construction  Construction activity, including use of cranes for tower installation and potential use of helicopters for conductor stringing, would be clearly noticeable on the skyline above existing vegetation in the middistance within open views north through rolling farmland. Felling through Wood of Darra is unlikely to be noticeable, but there would be some awareness of temporary access tracks through nearby fields in open, mid-distant views. The magnitude of change is assessed as Medium. The geographical extent would be medium, and the duration would be short-term.  Effects are identified as Moderate Adverse but non-		During Construction Residential Receptors: Moderate to Major Adverse (significant) Transport Receptors: Moderate Adverse (non-significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	viewpoint from nearest	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
			proposed tower (m)	significant for transport receptors as construction activity would be partially screened, or visible intermittently between intervening built form and vegetation in the mid-distance only.  View During Operational Phase -	Operational Phase – Year of	Operational Phase – Year of
				Year of Opening (Winter)  The Proposed Development would be visible in the middistance over a wide horizontal angle of view. Most towers would be seen against a backdrop of gently undulating landform and belts of field and roadside vegetation or intermittent blocks of woodland whilst others would partially impinge into the skyline. Some towers would be visible in their entirety in the mid-distance, although the lower sections of most towers would be screened by intervening topography, or occasional farmsteads and vegetation. More prominent, larger angle towers occur at regular intervals, increasing the concentration of infrastructure in the view, particularly to the west and east of the view. The magnitude of change is assessed as Medium. The geographical extent would be medium, and the duration would be long-term.  Effects are identified as Moderate Adverse but nonsignificant for transport receptors as the lower-level portions of many towers would be screened, whilst views towards upper portions would frequently be backdropped by vegetation or hills and seen in the mid-distance of transient views only.	Opening (Winter)  Medium	Opening (Winter) Residential Receptors: Moderate to Major Adverse (significant) Transport Receptors: Moderate Adverse (non-significant)
				View During Operational Phase - Year of Opening (Summer)	Operational Phase – Year of Opening (Summer) Medium	Operational Phase – Year of Opening (Summer)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				Summer foliage of field and road boundary trees and hedgerows would offer a small degree of additional visual screening, but due to the relative lack of deciduous vegetation in the view looking towards the Proposed Development through the open farmland, summer visibility would be similar to winter views. The magnitude of change is therefore not anticipated to change and would remain as Medium. The geographical extent would be medium, and the duration would be long-term.  Effects are identified as remaining Moderate Adverse and non-significant for transport receptors as views would be further softened in summer months by surrounding deciduous trees and vegetation.		Residential Receptors: Moderate to Major Adverse (significant) Transport Receptors: Moderate Adverse (non-significant)
				View During Operation Year 15 (Summer)  The replanting of commercial forestry through Wood of Darra back to the edge of the OC is likely to have re-established in this time, helping to filter views towards the Proposed Development towards the west. The majority of the view would, however, remain the same as year of opening due to the very limited extent of felling in the view. The magnitude of change is therefore not anticipated to change and would remain Medium. The geographical extent would be medium, and the duration would be long-term.  Effects are identified as remaining Moderate Adverse and non-significant for transport receptors as planting would strengthen existing screening, but overall, views would remain similar.	Operational Phase – Year 15 (Summer)  Medium	Operational Phase – Year 15 (Summer) Residential Receptors: Moderate to Major Adverse (significant) Transport Receptors: Moderate Adverse (non-significant)

				approximately 1 - 2 km to the east of the Culsh monument crossing mainly on lower ground. Whilst the majority of the Proposed Development would be		
				backclothed by surrounding fields and hills (particularly to the east), the tops of some towers would be skylined within the panoramic view, particularly to the north. The Proposed Development would		
				introduce a notable man-made vertical element into the rural landscape, including one angle tower in proximity to Loanhead of Fedderate to the northeast, which		
				would be clearly visible in the skyline. The Proposed Development to the north and northeast would be skylined and subsequently more noticeable		
				and distracting in the view, whereas wind turbines punctuate the skyline to the east, where the Proposed Development would		
				remain largely below the horizon line. The magnitude of change is assessed as <b>Medium</b> . The geographical extent would be		

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	viewpoint from nearest	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
			proposed tower (m)	medium to high, and the duration would be long-term.		
				View During Operational Phase - Year of Opening (Summer)  The elevated nature of the viewpoint results in panoramic views north and east across the lower-lying farmland, and whilst vegetation in summer would provide some additional screening of lower sections of towers and / or strengthening the backclothing of towers, some would remain on the skyline, particularly to the north. The magnitude of change is assessed as remaining <b>Medium</b> . The geographical extent would be medium to high, and the duration would be long-term.	Operational Phase – Year of Opening (Summer)  Medium	Operational Phase – Year of Opening (Summer)  Moderate to Major Adverse (significant)
				View During Operational Phase - Year 15 (Summer)  The replanting of commercial forestry at the A981 and around Milton of Culsh is likely to have re-established in this time. Due to the very limited extent of felling in the view, however, the view would change very little by Year 15. As a result, the majority of the view would remain the same as at year of opening. The magnitude of change is therefore not anticipated to change and would remain <b>Medium</b> . The geographical extent would be medium to high, and the duration would be long-term.	Operational Phase – Year 15 (Summer)  Medium	Operational Phase – Year of Opening (Summer)  Moderate to Major Adverse (significant)
Viewpoint 48: A981, New Deer (Representative)  Viewpoint location can be found on page 26 of Figure 7.6: Visua Amenity Receptors and Viewpoint Locations	View east from the A981 in New Deer (388720, 846945)	Residential – High  Transport - Medium	1480 m	Existing View The viewpoint is located on the eastern edge of New Deer on the A981. Eastern facing views are afforded across the adjacent farmland that extends towards the B9028, beyond Milltown of Auchreddie. The landscape is relatively open, comprised of farmland within a gently undulating landform of low hills,	N/A	N/A

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
Viewpoint visualisation found on: Visualisation 7.48: Viewpoint 48: A981, New Deer				but views are generally contained to the mid-distance by the relatively flat topography. Woodland within the local landscape helps contain views and provides a backdrop to built form and to surrounding detracting features which include wood poles / wires, occasional wind turbines, settlement infrastructure such as lighting columns, and the A981.		
				View During Construction  Construction activity, including use of cranes for tower installation and potential use of helicopters for conductor stringing, would be noticeable on the skyline in the mid-distance within northeast and east facing views, with the more open nature of the landscape at this point affording clearer views of construction activity from residents and road users travelling east. Most lower-level construction activity would be screened from view, but some may be discernible in open views towards one or two towers to the northeast of the view. Even so, activity would be limited to a small to medium portion of the view, with much of the activity screened by vegetation or built form. The magnitude of change is assessed as Low to Medium. The geographical extent would be low to medium, and the duration would be short-term.  Effects are identified as Moderate Adverse but nonsignificant for residential receptors as lower-level construction activity would be largely screened, visible in the mid-distance only and seen beyond foreground poles and	During Construction Low to Medium	During Construction Residential Receptors: Moderate adverse (non-significant) Transport Receptors: Minor to Moderate adverse (non-significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				View During Operational Phase - Year of Opening (Winter)  The Proposed Development would be perceptible within the mid-distance and background of views from this location with a small number of towers visible against the skyline to the northeast and east above the existing vegetation. Towers would impinge into the skyline over a relatively small portion of the view, with towers further east backclothed by vegetation and hills over a small to moderate portion of the view or screened beyond intervening coniferous vegetation. The magnitude of change is assessed as Low to Medium. The geographical extent would be low to medium, and the duration would be long-term.  Effects are identified as Moderate Adverse but nonsignificant for residential receptors as much of the lower-level portions of towers would be screened, fardistance views towards upper portions would be visible across a relatively small portion of the view, and whilst some would be skylined in the mid-distance across open farmland, they would be seen beyond foreground infrastructure.	Opening (Winter) Low to Medium	Opening (Winter) Residential Receptors: Moderate adverse (non-significant) Transport Receptors: Minor to Moderate adverse (non-significant)
				View During Operational Phase - Year of Opening (Summer)  Summer foliage of field boundary, curtilage and roadside vegetation would offer slight additional visual screening, but the Proposed Development would remain perceptible in the skyline and in the mid-distance to the north and east through the open arable farmland or would remain screened beyond coniferous	Operational Phase – Year of Opening (Summer)  Low to Medium	Operational Phase – Year of Opening (Summer) Residential Receptors: Moderate adverse (non-significant) Transport Receptors: Minor to Moderate adverse (non-significant)

				the Proposed Development on the skyline would still remain.		
A862, Kirkhill from K	View southeast and southwest from the A862, southwest of Cirkhill  354124, 844567)	Recreational – Medium to High  Transport – Medium to High	8858 m	Existing View  The viewpoint is located on the A862, which forms part of the North Coast 500 tourist route, to the southwest of Kirkhill. Views for users of NC500 on the A862 from Inverness to Beauly are low lying and broadly well contained to the south by surrounding woodland and coniferous forestry. The outlook to the south opens out between Drumchardine and the River Beauly towards forested hills associated with The Aird. This forms the background of attractive views along the route, particularly on passing to the north of Easter Moniack and Balchraggan, although there is a constant awareness of existing OHLs. The view is predominantly rural in character located at the base of the valley of the River Beauly with the steeply rising landform of The Aird and Tor Clunes containing views to near to mid-distant across the valley floor. Forestry forms a key feature across valley slopes with intermittent vegetation also scattered across the valley floor. There are few detracting features in the view.  View During Construction  Construction activity, felling of trees (particularly across The Aird) and temporary access tracks would all be readily perceived by road users on the A862 tourist route across the open valley floor. The construction activity would create uncharacteristic movement and height in the rural landscape and in close proximity to receptors		During Construction Recreational Receptors: Moderate to Major Adverse (significant) Transport Receptors: Moderate to Major Adverse (significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				the view and would be located alongside it for a short stretch at Easter Moniack. Construction activity would be seen across a moderate to high portion of the view and in very close proximity, albeit in transient views for road and recreational users. The magnitude of change is assessed as <b>Medium to High</b> . The geographical extent would be medium to high, and the duration would be short-term.		
				View During Operational Phase - Year of Opening (Winter)  Cyclists and vehicle users of this national tourist route would have intermittent, near, distant and open views to the Proposed Development in relation to their direction of travel along the A862. The Proposed Development crosses the A862 in the view, and towers would appear prominently in the skyline of transient views and in close proximity to the road, including the introduction of two angle towers in fields to the south. The Proposed Development would introduce new vertical man-made features into the rural view. Views of the proposed towers and the corridor through the forestry on the Aird for the OC would appear clearly visible across a wide portion of the view, disrupting the scenic view across the valley towards the rising land of The Aird to the south. The Proposed Development would be in close proximity and cross a large portion of the rural view. The magnitude of change is assessed as Medium to High. The geographical extent would be medium to high, and the duration	Operational Phase – Year of Opening (Winter) Medium to High	Operational Phase – Year of Opening (Winter) Recreational Receptors: Moderate to Major Adverse (significant) Transport Receptors: Moderate to Major Adverse (significant)
				would be long-term.  View During Operational Phase - Year of Opening (Summer)	Operational Phase – Year of Opening (Summer)	Operational Phase – Year of Opening (Summer)

Viewpoint and Type	Location	Receptor Type and Sensitivity	Approximate distance of	Description of Potential	Magnitude of Change	Significance of Effect
	(eastings and northings)		viewpoint from nearest proposed tower (m)	Impact during construction		
				Roadside vegetation would offer a reasonable degree of additional screening in summer months to the southwest, but the Proposed Development would remain a prominent detracting feature in open views across farmland to the southeast, including across the skyline of the view. The magnitude of change is therefore assessed as remaining <b>Medium</b> to <b>High</b> . The geographical extent would be Medium to High, and the duration would be long-term.	Medium to High	Recreational Receptors:  Moderate to Major Adverse (significant)  Transport Receptors: Moderate to Major Adverse (significant)
				View During Operational Phase - Year 15 (Summer)  Replanting of commercial forestry with native species within Long Wood back to the edge of the OC is likely to have re-established in this time. However, the small area of replanted forestry would only briefly provide any additional screening of towers, and the Proposed Development would remain visible for users of NC500 over a short, localised stretch. The overall effect is unlikely to change as a result and is anticipated to remain as Medium to High. The geographical extent would be medium to high, and the duration would be long-term.	Operational Phase – Year 15 (Summer) Medium to High	Operational Phase – Year 15 (Summer) Recreational Receptors: Moderate to Major Adverse (significant) Transport Receptors: Moderate to Major Adverse (significant)
Viewpoint 55: A82, Dochgarroch  (Specific)  Viewpoint location can be found on page 4 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.55: Viewpoint 55: A82, Dochgarroch	View northeast from the A82, Dochgarroch (261513, 840290)	Transport - Medium	1282 m	Existing View The viewpoint is located off the A82 towards Dochgarroch, to the west of the Caledonian Canal. Users of the A82 between Inverness and Lochend experience changeable, attractive views through the River Ness valley. This viewpoint is enclosed by valley sides and belts of trees to the north, and vegetation along the canal to the east, containing views. Pockets of woodland through the valley and mature roadside vegetation create a varied visual experience, with this viewpoint being an intimate,	N/A	N/A

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				enclosed wooded valley landscape. There are few detracting features in the view, save for the A82 itself.		
				View During Construction	During Construction	During Construction
				Construction activity, including felling on The Aird and temporary access tracks would not be visible from this location, filtered by intervening topography and vegetation. Views of taller elements of the construction process, including use of cranes for tower installation and potential use of helicopters for conductor stringing, would be visible above the existing vegetation across a small portion of the view. Activity would be restricted to a small portion of the view, with most works entirely screened by intervening vegetation. The magnitude of change is assessed as Low. The geographical extent would be low, and the duration would be short-term.	Low	Minor Adverse (non-significant)
				View During Operational Phase - Year of Opening (Winter)  The Proposed Development would be barely perceptible within views from this location, with only glimpsed views of the tops of towers likely to appear noticeable within the landscape. The dense vegetation and landform would serve to limit views from road users with only glimpsed and localised views towards the towers likely to appear heavily filtered through gaps in the existing vegetation. Overall, views towards the Proposed Development would be barely perceptible from this location with views filtered by intervening vegetation, even in winter. The magnitude of change is assessed as Negligible. The geographical extent would be negligible, and the duration would be long-term.		Opening (Winter)  Negligible Adverse (nonsignificant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				View During Operational Phase - Year of Opening (Summer)  Roadside vegetation would strengthen the existing screening in summer months, with the Proposed Development remaining barely perceptible from this section of the A862 within transient, intermittent views. The magnitude of change is assessed as remaining Negligible. The geographical extent would be negligible, and the duration would be long-term.	Operational Phase – Year of Opening (Summer)  Negligible	Operational Phase – Year of Opening (Summer)  Negligible Adverse (nonsignificant)
Viewpoint 56: The Bin  (Specific)  Viewpoint location can be found on page 20 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.56: Viewpoint 56: The Bin	View north from the summit of The Bin (350312, 843882)	Recreational - Medium	5571 m	Existing View  The viewpoint is located on the summit of The Bin where a brief, but expansive view is afforded across the wider landscape to the north and west across the valleys associated with the River Isla and the River Deveron. Recreational users of footpaths at The Bin Forest experience contained, tranquil views as a result of the surrounding dense coniferous forestry on The Bin. Views towards the lower parts of the valley are partially screened by the existing plantation that lies on the lower slopes of The Bin.	N/A	N/A
				View During Construction  Construction activity would be visible across the wider landscape to the north from the more open summit of The Bin with construction plant and forestry works associated with the OC likely to appear as a visible change within the landscape. The construction activity would be largely backdropped by the surrounding landscape although the construction of towers (particularly the use of cranes for tower installation and potential use of helicopters for conductor stringing) to the northwest across higher ground at Hill of	During Construction  Low	During Construction  Minor Adverse (non-significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
			proposed tower (III)	Greenwood and The Balloch would be skylined. Lower-level activity would be screened from view, with visibility of tower construction available across a short section of transient, glimpsed views, and within views where the focus is on the broader surrounding landscape. The magnitude of change is assessed as Low. The geographical extent is a low to moderate change in a localised area and the duration would be short-term.  View During Operational Phase - Year of Opening (Winter)  Users of footpaths at the summit of The Bin would have views towards the Proposed  Development. Where visible however, views would be backdropped by the existing forestry and elevated landform within the wider landscape to the north across the valley and as such it would not appear visually prominent. Where towers and removed vegetation on Hill of Greenwood are visible, these would be seen within the background of views and as such would be unlikely to detract notably form the scenic quality of the landscape within the view. The magnitude of change is therefore assessed as Low. The geographical extent is a low to moderate change in a localised	Operational Phase – Year of Opening (Winter) Low	Operational Phase – Year of Opening (Winter) Minor Adverse (non-significant)
				area within panoramic views and the duration would be long-term.  View During Operational Phase - Year of Opening (Summer)  Summer views would remain similar to winter views, with coniferous forestry on The Bin continuing to screen immediate views for footpath users. Where views are afforded, there would similarly be no noticeable change	Operational Phase – Year of Opening (Summer) Low	Operational Phase – Year of Opening (Summer)  Minor Adverse (non-significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
	(eastings and northings)		proposed tower (m)			
				Proposed Development visible within brief elevated views. The magnitude of change is assessed as remaining <b>Low</b> . The geographical extent is a low to moderate change in a localised area and the duration would be long-term.		
Viewpoint 57:	View south from unnamed road,	Residential – High	5571 m	Existing View	N/A	N/A
Viewpoint 57: Inverkeithny  (Representative)  Viewpoint location can be found on page 22 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.57: Viewpoint 57: Inverkeithny	south of Inverkeithney (363005, 845375)			The viewpoint is located off a local unnamed road to the south of Inverkeithny. The view is broad and far-reaching, looking across a varied landscape towards distant hills. Forestry and vegetation cover is present throughout the wider landscape to the south, with intermittent residential dwellings and farmsteads visible across the view. The landscape is attractive and undulating with few detracting features with the exception of the single turbine at North Balnoon and telegraph poles visible within the foreground.		
				View During Construction  Construction activity and forestry works associated with the OC would be perceptible within mid to far distant views to the south, albeit intercepted and filtered in places by the existing landform, vegetation and built form that lies within the wider landscape at this point. Construction would be seen across a moderate portion of the view, however generally backdropped by undulating farmland and woodland within mid to far distance views as the route travels westwards. Views against the skyline are likely to be limited to glimpsed view of the use of cranes for tower installation and potential use of helicopters for conductor stringing. The magnitude of change is assessed as Low. The		During Construction  Minor to Moderate Adverse (non-significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				geographical extent would be low, and the duration would be short-term.		
				View During Operational Phase - Year of Opening (Winter)  The Proposed Development would appear as a perceptible feature within mid-distance views, backclothed by the existing landform within the wider landscape to the south and filtered to a degree by the existing vegetation that characterises the landscape. Although the towers would be visible, they are unlikely to appear prominently within middistance views due to appreciable distance. The Proposed Development would therefore not substantially change the baseline characteristics of the view. The magnitude of change is assessed as Negligible to Low. The geographical extent would be low, and the duration would be long-term.	Opening (Winter)  Negligible to Low	Operational Phase – Year of Opening (Winter)  Minor to Moderate Adverse (non-significant)
				View During Operational Phase - Year of Opening (Summer)  In summer months, intervening field and curtilage vegetation and intermittent small areas of deciduous woodland would provide slight additional screening, but the Proposed Development would remain perceptible within the landscape. The magnitude of change is assessed as remaining  Negligible to Low. The geographical extent would be low, and the duration would be long-term.	Operational Phase – Year of Opening (Summer)  Negligible to Low	Operational Phase – Year of Opening (Summer)  Minor to Moderate Adverse (non-significant)

				Effects are identified as remaining <b>Moderate Adverse</b> and <b>non-significant</b> for transport receptors as planting would strengthen existing screening, but overall, views would remain similar.		
Viewpoint 62: Inchberry  (Representative)  Viewpoint location can be found on page 16 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.62: Viewpoint 62: Inchberry		Residential - High  Transport - Medium	1301 m	Existing View  The viewpoint is located on an unnamed local road on the eastern edge of Inchberry within The Spey Valley SLA. The landscape within the view is predominantly rural, characterised by the flat valley floor of the River Spey with the rising landform to the east towards the Wood of Ordiequish and more gently sloping landscape to the west of Inchberry. Views are afforded east across the River Spey valley, across a mosaic of farmland with areas of woodland in the fore and midground, and backclothed by Thief's Hill and Whiteash Hill and associated Wood of Ordiequish. The landscape is relatively well contained within views with the elevated valley sides and dense vegetation limiting views towards the wider landscape and creating a more enclosed character. There are visible sections of an existing 275 kV OHL in close proximity that crosses the landscape from west to east before rising up Ordiequish Hill. A more distant 132 kV OHL is also visible across the River Spey valley and Ordiequish Hill, backclothed by surrounding vegetation and hills.  View During Construction  Construction activity is likely to appear clearly visible within views from this location with felling works required for the OC to extend up the western slope of Ordiequish Hill and lower-level	During Construction Medium	During Construction Residential Receptors: Moderate to Major Adverse (significant) Transport Receptors: Moderate Adverse (significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				construction to appear visible within the mid-distance of views across the more open valley floor due to the limited screening vegetation. Taller features within the construction process, including use of cranes for tower installation and potential use of helicopters for conductor stringing, would be clearly noticeable in the skyline of mid to far distant views for all receptors. The magnitude of change is assessed as Medium. The geographical extent would be medium, and the duration would be short-term.  View During Operational Phase - Year of Opening (Winter)  The Proposed Development would be particularly prominent within eastern views and across a moderate portion of the view. The Proposed Development would be particularly prominent within eastern views as it extends across open fields at Orbliston before crossing the River Spey and Ordiquish Hill, forming the background of views. The removal of woodland to accommodate the OC across Ordiequish Hill may also emphasize the Proposed infrastructure by creating an artificial straight line across the hillside. Furthermore, the Proposed Development would be visible beyond the existing 275 kV OHL, creating a degree of wirescaping within views. The introduction of additional, large-scale infrastructure into views is would further detract from the elements of scenic quality in the landscape. The magnitude of change is assessed as Medium. The geographical extent would be	Operational Phase – Year of Opening (Winter)  Medium	Operational Phase – Year of Opening (Winter) Residential Receptors: Moderate to Major Adverse (significant) Transport Receptors: Moderate Adverse (significant)
				low to medium, and the duration would be long-term.

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
Viewpoint and Type  Viewpoint 63: A95 / B9018, Keith  (Representative)  Viewpoint location can be found on page 20 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.63: Viewpoint 63: A95/ B9018, Keith	(eastings and northings)  View southwest from the junction of the A95 and B9018, Keith  (346065, 851924)	Residential – High  Transport – Medium		Existing View  The viewpoint is located at the junction of the A95 and the B9018 to the east of Keith. The landscape within the view is predominantly rural in character with relatively open views across the River Isla valley landscape beyond the A95 which lies within the foreground. Beyond the river the landform begins to rise with the topography limiting views towards the wider landscape to a degree. Predominantly open and far-distant views are afforded of the surrounding landscape, which are backclothed by Meikle Balloch Hill, Little Balloch Hill, Sillyearn Wood and Knock Hill to the south. Views towards the rising landscape to the west are more readily available with glimpsed views towards the Hill of Towie and Hill of Mulderie.	N/A	N/A
				Woodland over Meikle Balloch Hill is visible in the background to the south. Detracting features associated include the main road, existing 400 kV and 132 kV OHLs in the background and telegraph poles within the foreground. Windfarms at Cairds Hill and Blackhill are also visible against the skyline within the view, further detracting from the scenic quality of the landscape at this point.		
				View During Construction  There would be no discernible changes due to felling of managed commercial forestry and native broadleaf woodland beyond the OC or for temporary access tracks, as the small areas of woodland at Aultmore are not a key feature in most mid-distant views. As the landscape is largely open, clear views of the full extent of some tower construction would be available, with use of cranes for tower installation and	<u>During Construction</u> Medium	During Construction Residential Receptors: Moderate to Major Adverse (significant) Transport Receptors: Moderate Adverse (significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				potential use of helicopters for conductor stringing particularly noticeable features in the skyline of views. The magnitude of change is assessed as <b>Medium</b> . The geographical extent would be medium, and the duration would be short-term.		
				View During Operational Phase - Year of Opening (Winter)  The Proposed Development, including angle towers, would be a noticeable feature within views for all receptors. It would be seen in proximity to Newmill and to the east of Keith as a prominent feature impinging into the skyline. It would be broadly framed within views by the topography of Millstone Hill and the Hill of Brae. Views of the Proposed Development would, however, be intermittent as a result of intervening areas of woodland. There would be clear views of the diamond crossing where the Proposed Development crosses the existing 132 kV OHL just to the south of the A95, railway line and River Isla. The increase in infrastructure to the northeast of Keith would result in a wirescaping effect, detracting further from the rural upland landscape. The magnitude of change is therefore assessed as Medium. The geographical extent would be medium, and the duration would be long-term.	Operational Phase – Year of Opening (Winter)  Medium	Operational Phase – Year of Opening (Winter) Residential Receptors: Moderate to Major Adverse (significant) Transport Receptors: Moderate Adverse (significant)
				View During Operational Phase - Year of Opening (Summer) Limited blocks of woodland across the landscape would result in open views remaining in summer, such that visibility would remain similar to winter views. Whilst the presence of some field boundary vegetation and vegetation within the wider landscape may provide some	Operational Phase – Year of Opening (Summer)  Medium	Operational Phase – Year of Opening (Summer) Residential Receptors: Moderate to Major Adverse (significant) Transport Receptors: Moderate Adverse (significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				intermittent screening or filtering of views; many receptors would still experience views across the landscape towards the Proposed Development. The magnitude of change is therefore assessed as remaining <b>Medium</b> . The geographical extent is medium, and the duration would be long-term.		
Viewpoint 64: Meikle Balloch Hill  (Specific)  Viewpoint location can be found on page 20 of Figure 7.6: Visual Amenity Receptors and Viewpoint Locations  Viewpoint visualisation found on: Visualisation 7.64: Viewpoint 64: Meikle Balloch Hill	Views southeast, southwest and northwest from the summit of Meikle Balloch Hill (346964, 849341)	Recreational – Medium to High	1934 m	Existing View  The viewpoint is located on the summit of Meikle Balloch Hill.  Informal footpaths also lead up to the exposed open moorland summit, where there are farreaching panoramic views across the landscape of Moray and Aberdeenshire. Views from the summit of Meikle Balloch Hill look across the canopies of trees on the slopes of Balloch Wood in the foreground and onto agricultural fields and settlements including Keith in the mid-distance, and forested hills in the background of all sides. Whilst there are urban features in the view such as Blackhillock substation, Keith and existing 132 kV and 275 kV OHLs, they do not detract from the overall visual experience of an extensive, attractive, undulating and well wooded landscape punctuated by landmark, forested hills.	N/A	N/A
				View During Construction  Users of path KT-27 and informal paths at the summit of Meikle Balloch Hill would afford broad views of the surrounding panoramic landscape, in which construction of the Proposed Development would be seen over a relatively small proportion of the overall panorama, and in the lower portion of wider views, with the landscape to the west of Keith stretching out beyond. The use of cranes for tower installation and		During Construction  Moderate Adverse (significant)

Viewpoint and Type	Location (eastings and northings)	Receptor Type and Sensitivity	Approximate distance of viewpoint from nearest proposed tower (m)	Description of Potential Impact during construction	Magnitude of Change	Significance of Effect
				View During Operational Phase - Year of Opening (Winter)  The Proposed Development would be a highly noticeable feature within views, it would interrupt the skyline and detract from the rural, open character of the landscape, impinging into the skyline and replacing the skyline of more distant hills. The presence of an increased number of OHL infrastructure in the vicinity would create a degree of wirescaping in views. Further west views would be afforded a degree of screening by existing vegetation however, due to the scale and height of the proposed towers, they would remain clearly visible against the skyline. The magnitude of change is assessed as High. The geographical extent would be Medium to High, and the duration would be long-term.	Operational Phase – Year of Opening (Winter)  High	Operational Phase – Year of Opening (Winter) Residential Receptors: Major Adverse (significant) Transport Receptors: Moderate to Major Adverse (significant)
				View During Operational Phase - Year of Opening (Summer)  In summer months, deciduous garden, field and roadside vegetation would provide a degree of additional screening, but the Proposed Development would remain a prominent feature in the skyline, particularly within more open views. The magnitude of change is assessed as remaining High. The geographical extent would be medium to high, and the duration would be long-term.	Operational Phase – Year of Opening (Summer) High	Opening (Summer) Residential Receptors: Major Adverse (significant) Transport Receptors: Moderate to Major Adverse (significant)
